Summary

Website Chronometer

The following project presents a Chrome extension.

Our Chrome extension aims to increase concentration and productivity of people by restricting their access to useless websites. The idea is to stay focused on your work without wasting time while surfing the Web.

The Chrome extension allows the user to block selected web page after a fixed time. At midnight the user again has the opportunity to choose the same or a different URL and set a new time to be reported.

After the time has expired the user is automatically transferred to the search engine in "*Google Chrome*" each time he tries to enter the website. That way the access to the relevant website is denied. Only after midnight the web site can be visited again.

For the project development are used the following programming languages: JavaScript, HTML, CSS, and the jQuery JavaScript library.

This Chrome extension has been used and tested by three people. According to observations it can be noticed that there is a big improvement of the users' concentration and performance.
